Contents

This is a very messy document. This document is entirely done when I started thinking about writing notes using Emacs org-mode a long time ago. You may want to use some of the templates/styles mentioned here at your own risk! It absolutely comes with no warranty.

1 Basic Usage of Org-mode

This is under the section heading "Basic Usage of Org-mode"

1.1 Itemize and Enumeration

This is under the subsection heading "Itemize and Enumeration"

- item 1

- item 2

- item 3
  bold *italic* <u>underlined</u> ~~strike-through~~ Greek letter Γ

Some enumerated items

1. First

2. Second

3. Third

Inserting link is very easy. Just type C-c C-l type the actual link followed by the description of the link that will appear in the document.

1.2 Quote and examples

> Everything should be made as simple as possible but not simpler
> – Albert Einstein

```
Here is an example
: Some example from a text file.
```

1.3 Exporting Org Documents

I normally export org files to latex/pdf or html that includes latex math formulas/symbols and by default the exported files include title, author, date, . . .

However, exporting Org file to Markdown does not include title, author, dates,. . .

The default *org-mode* does not have the option to export .org file to *markdown* (.md file). For that you will need to replace the **org** layer in *dotspacemacs* file with the following

```
(org :variables
     org-enable-github-support t)
```

$$x = \sqrt{b}$$

Note: In case C-c C-e command doesn't show the export option for m (markdown), then simply open dotspacemacs file and compile it with M-SPC f e R. After that, you should see the option to export to markdown!
